

Tracko

Sales, customer and payment tracking for informal traders — built for the NITHUB Innovation Fair Hackathon 2026

1. What Tracko Is

Tracko is a lightweight tool that helps informal traders — market sellers, small shop owners, and independent vendors — track their sales, store customer information, follow up with buyers, and confirm delivery, all in one place. Most traders currently manage this through memory, a paper notebook, or scattered WhatsApp chats, which makes it hard to know who owes money, who buys regularly, and whether the business is actually profitable.

For the hackathon, Tracko is being extended with the BMONI API for payments and wallets, and an AI layer for customer communication and business insights, in line with the theme “Intelligent Money for Everyone.”

2. The Problem

- Informal traders have no reliable record of who bought what, when, and whether they paid.
- Payment collection is manual — cash or ad-hoc bank transfers — with no automatic confirmation.
- Customer follow-up (payment reminders, delivery updates, restock nudges) is done manually or not at all.
- Traders have no visibility into basic business health: revenue trends, best customers, repeat-purchase patterns.
- Because there is no transaction history, traders can't access credit, loans, or savings products built around their actual sales.

3. The Solution

Tracko gives traders a simple system to log customers and orders, take payments through BMONI, and let AI handle the busywork — drafting follow-up messages and turning raw sales data into plain-language insights.

Core capabilities:

- **Customer & order log** — add a customer, record what they bought, price, and delivery status.
- **Payments via BMONI** — generate a payment request per order; order status updates automatically once BMONI confirms payment.
- **AI-drafted follow-ups** — one tap generates a payment reminder, delivery update, or restock nudge message to send to the customer.

- **AI business insights** — a plain-language summary of sales performance: top customers, repeat buyers, revenue trend over time.

4. Why BMONI Matters Here

BMONI is not a bolt-on payment button — it is the backbone of the order record. A sale in Tracko isn't marked complete until BMONI confirms the payment, which means every order carries real transaction data. Over time, this creates a verified payment history for traders who have never had one — the same history that could eventually unlock credit, savings products, or better financial terms for people who are otherwise excluded from formal financial systems.

Relevant BMONI capabilities for this build:

- Multi-currency wallets (Naira / USD) for receiving and holding payments.
- Stablecoin-backed USD balances, useful for traders wanting to protect savings from Naira depreciation.
- Virtual/physical Mastercard card issuance, for spending directly from wallet balances.
- Biometric-secured access, removing reliance on PINs/passwords for account security.

5. Who It's For

- Market traders and small retailers selling physical goods (fabric, food items, provisions, etc.)
- Independent vendors who sell via WhatsApp/Instagram and fulfill orders manually
- Small business owners who need basic bookkeeping but can't afford or don't need a full accounting system

6. MVP Feature Scope (Hackathon Build)

Scoped to be realistically buildable before the July 28 deadline. Anything beyond this is noted as future roadmap, not built for the demo.

Feature	Description	Priority
Customer & order log	Add customer, item, price, delivery status	Must-have
BMONI payment link per order	Generate payment request tied to an order; auto-mark 'Paid' once confirmed	Must-have
AI follow-up message drafting	Generate a reminder/delivery/restock message from order status, one-tap send	Must-have
AI insights dashboard	Summarize top customers, repeat-purchase patterns, and revenue in plain language	Must-have
Multi-currency support	Naira/USD wallet switching for cross-border sellers	Stretch / roadmap
AI-driven credit scoring	Use payment history to assess loan/credit readiness	Stretch / roadmap

7. What We Need to Build This

Team roles (up to 3 people)

Role	Responsibility
Product / Frontend	App UI — order log, dashboard, customer list, demo flow polish
Backend / Integrations	BMONI API integration, payment webhook handling, data storage
AI / Prompting	AI message generation, insights summarization, prompt design and testing

Technical requirements

- BMONI API access/sandbox credentials for wallet + payment request functionality
- An AI API (e.g. Claude) for message generation and insights summarization
- Simple backend/database to store customers, orders, and payment status (e.g. lightweight web app + hosted DB)
- Frontend framework for a clean, mobile-first UI — traders will primarily use this on a phone
- Pre-seeded demo data (past orders/customers) so the insights dashboard isn't empty on stage

Non-technical requirements

- Pitch deck covering: problem, solution, demo, why BMONI, why now, roadmap
- A rehearsed live demo script, with a recorded backup in case of live/network issues
- Clear articulation of the 'Intelligent Money for Everyone' angle — Tracko serves traders who are usually the least served by financial tools

8. Demo Flow (Reference)

Step	What Happens	Time
1. The problem	Introduce a trader who tracks sales in a notebook / WhatsApp	~15 sec
2. Add an order	Add a customer and order in Tracko in one tap	~30 sec
3. BMONI payment	Generate payment request; simulate payment; order auto-marks as paid	45 sec
4. AI follow-up	Tap to generate a delivery update message; send with one tap	~30 sec
5. AI insights	Show dashboard: top customer, revenue trend, plain-language summary	45 sec
6. The vision	Tie payment history to future credit/savings access; close on the note	20 sec

9. Beyond the Hackathon (Roadmap)

- AI-driven credit scoring based on verified BMONI payment history
- Multi-currency wallet support for traders serving diaspora/cross-border customers
- Inventory tracking tied to sales data, so restock alerts are automatic
- Voice-first / local-language interface to reach traders with lower literacy or limited typing comfort
